

READING A JUG OF JUICE

- 1 The jug is marked every 100 ml up to 1000 ml. The nearest big mark below the liquid is **600** ml.
- 2 Count the little 50 ml marks up from 600 to the liquid line: one mark = **50** ml.
- 3 Add: $600 \text{ ml} + 50 \text{ ml} = \mathbf{650 \text{ ml}}$.

WARM-UP

Read the amount each filled jug shows, then shade the blank jug to the target.

1. Read Jug A and Jug B, and write how many millilitres each one holds.
2. Read Jug C carefully at eye level and write its amount.
3. Shade Jug D up to the 300 ml mark.

PRACTICE

- 1 Sam pours orange juice into a jug at the shop. The liquid line sits between the marks. Read Jug A to find how many millilitres it holds.
- 2 A carton of milk is poured into a jug on the counter. Read Jug B to find how many millilitres of milk are in it.
- 3 A jug of water stands beside the fruit on the shop shelf. Read Jug C carefully, eye level with the line, to find how many millilitres it holds.

IRISH FACT

How much milk in the carton?

A standard Irish milk carton holds **1 litre**, which is the same as **1,000 ml** — enough to fill about **four** large glasses.

Typical Irish supermarket packaging

REFLECT

When you estimated the jug first, how close were you — and what helped your next estimate?
