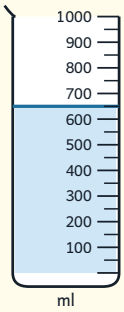
Lesson 49

Capacity – estimate and measure in l and ml with a jug

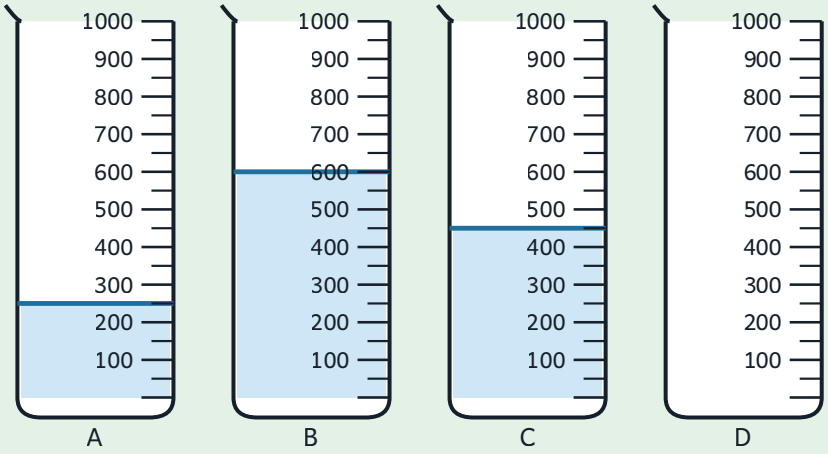
READING A JUG OF JUICE

1. The jug is marked every 100 ml up to 1000 ml. The nearest big mark below the liquid is **600** ml.
2. Count the little 50 ml marks up from 600 to the liquid line: one mark = **50** ml.
3. Add: 600 ml + 50 ml = **650** ml.



WARM-UP

Read the amount each filled jug shows, then shade the blank jug to the target.



1. Read Jug A and Jug B, and write how many millilitres each one holds.
2. Read Jug C carefully at eye level and write its amount.
3. Shade Jug D up to the 300 ml mark.

PRACTICE

1. Sam wants to fill Jug A up to the **1 litre** mark for the shop. Read Jug A, then work out how many more millilitres he needs.
2. A carton of milk fills Jug B. Read Jug B, then work out how many more millilitres would bring it up to **1 litre**.
3. A jug of water stands on the shop shelf. Read Jug C at eye level, then work out how much is left after **200 ml** is poured out.

REFLECT When you estimated the jug first, how close were you — and what helped your next estimate?

MEASURES
