

LINES OF SYMMETRY OF A SQUARE

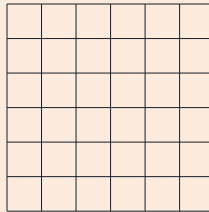

- 1 The dashed line down the middle matches both halves, so that is 1 line of symmetry.
- 2 The dashed line across the middle also matches, so that is 2.
- 3 Fold along each diagonal and the halves match too, so a square has 4 lines of symmetry in all.

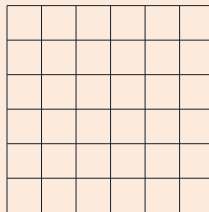

WARM-UP

On the grid, draw each shape and rule in all of its lines of symmetry.

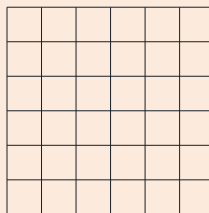

1. Draw a square and rule in all of its lines of symmetry.

2. Draw a rectangle and rule in all of its lines of symmetry.

3. Draw the letter T and rule in all the lines of symmetry it has.

PRACTICE

- 1 A carpenter is building an equilateral triangle window. How many lines of symmetry can he fold across it? _____

SPOT THE MISTAKE

Cian marks the lines of symmetry on a rectangle that is not a square:

2 lines through the midpoints of opposite sides
 2 diagonal lines corner to corner
 Total: 4 lines of symmetry

Cian has counted too many. Which lines are not lines of symmetry, and how many does the rectangle really have?

Explain _____ Answer _____
