Repeat · Evidence · Evaluate

Our question

When we repeat our heating or cooling fair test, does the same material still win?

Our matching trials (leave out any trial that used a different measure or window)

Trial	What we measured	Reading
Trial 1		
Trial 2		
Trial 3		

Our middle value (three matching trials) or our pattern (two)

Did our prediction hold? What do the numbers show?

One way we would improve the test next time

On the class chart, which result stands out, and why might two careful groups differ?
