

Present the design analysis

engineering

What you need: bird feeder prototype from earlier in this project · Investigation Journal pages from earlier in this project (including Design Brief and test notes) · presentation paper for short cue notes · pencils

Words to use

Design analysis · Iterative design · User need

User need – what the birds needed the feeder to do

One design choice we made, and why

Test evidence – what the watering-can or balance test showed

What changed after testing, and why (be honest about what failed first)

One clear next step if the design were developed further
